

EDUCATION

University Of Illinois Chicago

Bachelor of Arts in Computer Science

Chicago, Illinois

Expected: May 2027

- Programming Languages: C, C++, Python, Go, SQL
- Tools & Frameworks: Git, GitHub, SQLite, Gin, GORM, JSON
- Relevant Courses: Data Structures & Algorithms, Software Design, Machine Organization, Languages & Automata, Programming Language Concepts, Programming Practicum (C Programming)

PROJECTS

GitHub Activity Bot | Go, Docker, Railway, Gmail SMTP

Jun 2026

- Built a personal automation tool in Go that fetches commit activity across all GitHub repositories via the REST API and delivers a formatted daily digest via Gmail SMTP.
- Designed a modular architecture separating concerns across github, report, notifier, and scheduler packages.
- Containerized with a multi-stage Docker build reducing image size, and deployed to Railway for 24/7 cloud execution.
- Implemented a ticker based scheduler that checks activity on a configurable interval and fires reports at a set time daily.

Campus Pathfinding System | C++, Graphs, Dijkstra, JSON

Mar 2025 – May 2025

- Modeled buildings, waypoints, and walkways as a weighted adjacency-list graph by parsing JSON map data into custom C++ structures.
- Implemented Dijkstra's shortest-path algorithm with a priority queue to compute optimal walking routes between locations.
- Connected buildings to nearby nodes and handled blocked or ignored vertices to simulate realistic navigation constraints.
- Designed reusable graph and utility classes with efficient edge lookups and clean separation of concerns for readability and performance.

Chicago Traffic Camera Data Analysis | Python, SQLite, SQL, Matplotlib

Jan 2026 – Feb 2026

- Built an interactive, menu-driven Python application to explore and analyze Chicago traffic camera data stored in SQLite, supporting queries across thousands of violation records.
- Wrote complex SQL queries using joins, unions, grouping, and window functions to compute statistics by intersection, camera ID, date, month, and year.
- Implemented reporting features for camera lookup, violation percentages, yearly/monthly trends, and intersection-level summaries with formatted console output.
- Integrated Matplotlib visualizations to plot time-series trends and geographic camera locations on a city map for clearer interpretation of patterns.

EXPERIENCE

Bytime — Productivity App (Sparkhacks Project)

UIC, Chicago, IL

Team Project with 5 Members

Spring 2025

- Collaborated in a team of 5 to design a social platform for CS student productivity, including features for study tracking and peer collaboration
- Planned system architecture, database schema, and frontend/backend workflows
- Managed team workflow, delegated tasks, and coordinated development using Git and GitHub, ensuring smooth collaboration and version control.
- Presented project design, technical decisions, and potential product impact to judges and peers, highlighting technical proficiency and communication skills.
